CIMCO's response to the Apache Log4j vulnerability

In early December 2021, a critical vulnerability was discovered in the widely-used logging tool Log4j, which is normally used by software developers to record (log) user activity and the behavior of applications for subsequent review.

The Log4j framework is Java-based and distributed free by the nonprofit Apache Software Foundation. https://logging.apache.org/log4j

None of CIMCO's software is based on Java, Apache, or uses the Log4j framework, and is therefore not affected by the Log4j vulnerability/CVE.
